

# Find and use code that already exists

## Stop wasting time rewriting code.

With Sourcegraph, engineers can identify existing code libraries for reuse and promote innersourcing to avoid spending time on problems a teammate already solved.

| You need to...   | With Sourcegraph you can...  |
|--|--|
|  <b>Find code to reuse</b>                         | Find out if a teammate has already solved your problem. Quickly search across all your repositories to find the code you need.   |
|  <b>Improve code stability and trustworthiness</b> | Code reuse avoids introducing preventable bugs. By using a reviewed and tested piece of code that's known to work, you can feel confident that your code is secure and stable. |
|  <b>Automate PRs to make code consistent</b>       | Whether refactoring duplicate code or updating a shared library, automate changes seamlessly across your codebase and stop wasting time on manual updates.                     |
|  <b>Alert for deprecated code use</b>              | Monitor and get alerts when someone uses out-of-date libraries or deprecated functions, so you know who to work with on updates and adoption.                                  |
|  <b>Track your code reuse efforts</b>             | Get visibility into code reuse progress. Easily track the prevalence of shared code in your codebase over time.  |

Engineering teams at the world's most innovative companies use Sourcegraph to understand, fix, and automate across their entire codebase.

## FACTSET

"If I'm developing code for a library that might draw charts, for example, we don't want 30 different ways to draw a chart at FactSet. With Sourcegraph, I can search the code to find other chart examples, and simply copy the code. This saves us time and ensures consistency."

**Joseph Majesky | Software Engineer at FactSet**

## Get the most out of your existing code.

Make it easier to discover and validate reusable code, so your teams can spend more time solving new problems and less time rewriting code.
